Over the last several years, programs have been introduced in the conservation field with the goal of increasing diversity in the workforce. However, there is still a lack of diversity in the field with people of color making up less than 12% of total staff working with general conservation and environmental organizations.

The Land Trust Alliance, a national nonprofit land conservation organization, and the USDA Forest Service developed a pilot initiative called the Scholars for Conservation Leadership Program (SCLP). The program was designed to expand career development

opportunities to undergraduate students of color who are interested in pursuing a career in conservation. Through SCLP, students engage in career development activities and events, network with and receive mentorship from conservation practitioners, and attend a national conference. During the program, students were asked to complete pre and post surveys to share their experiences and perspectives.

Researchers reported results of the surveys recently in *Natural Sciences Education*. They found that the pilot SCLP achieved the goals of expanding career development opportunities to students of color and increasing their interest in pursuing a career in conservation. All surveyed scholars said they would recommend the SCLP to their peers, and the Land Trust Alliance plans to continue the program in the future.
